Service Manual

For model N260 - a 2.4 cu. ft., 2-way refrigerator.
For model N260.3 - a 2.4 cu. ft., 3-way refrigerator.
Introduction

This Service Manual supplies information for the experienced repair technician. The repair technician should have working knowledge of the operation of an absorption refrigerator system and should have basic knowledge of LP gas and electrical systems.

Read and understand the Installation and Owner’s Manual, all service procedures, cautions and warnings before doing any service work on the refrigerator. If you are unable to resolve the problem by using this Service Manual, technical service support is available at 1-800-444-7210.

Only use genuine Norcold replacement parts on the refrigerator. Generic parts do not meet Norcold’s specifications for reliability, performance, and safety.

Safety Awareness

Read this manual carefully and understand the contents before you install and operate the refrigerator.

Be aware of possible safety hazards when you see the safety alert symbol on the refrigerator and in this manual. A signal word follows the safety alert symbol and identifies the danger of the hazard. Carefully read the descriptions of these signal words to fully know their meanings. They are for your safety.

**WARNING:** This signal word identifies a hazard, which if ignored, can cause dangerous personal injury, death, or much property damage.

**CAUTION:** This signal word identifies a hazard, which if ignored, can cause small personal injury or much property damage.

Safety Instructions

- This refrigerator is equipped for the use of LP gas only and can not be changed to use any other fuels (natural gas, butane, etc.).
- Incorrect installation, adjustment, changes to, or maintenance of this refrigerator can cause personal injury, property damage, or both.
- Obey the instructions in this manual to install the intake and exhaust vents.
- Do not install the refrigerator directly on carpet. Put the refrigerator on a metal or wood panel that extends the full width and depth of the refrigerator.
- LP gas can cause a fire or an explosion that can result in property damage, personal injury, or death. Do not smoke or create sparks while doing any work on the LP gas supply system. Do not use an open flame to examine the LP gas supply piping or fittings for leaks.
- To avoid possible LP gas leaks, always use two wrenches to tighten or loosen the LP gas supply line connections.
- Make sure the electrical installation obeys all applicable codes. See the “Certification and Code Requirements” section of the “Owner’s Manual and Installation Manual”.
- Disconnect both the AC and DC power sources before doing any maintenance work on the refrigerator.
- Do not bypass or change the refrigerator’s electrical components or features.
- Do not spray liquids near electrical outlets, connections, or the refrigerator components. Many liquids are electrically conductive and can cause a shock hazard, electrical shorts, and in some cases fire.

- The refrigerator cooling system is under pressure. Do not try to repair or to recharge a defective cooling system. The cooling system contains sodium chromate. The breathing of certain chromium compounds can cause cancer. The cooling system contents can cause severe skin and eye burns, and can ignite and burn with an intense flame. Do not bend, drop, weld, move, drill, puncture, or hit the cooling system.

- The storage of flammable materials behind or around the refrigerator creates a fire hazard. Do not use the area behind the refrigerator to store flammable materials (gasoline, cleaning supplies, etc.)

- Do not remove the round ground prong from the refrigerator AC power cord. Do not use a two prong adapter or extension cord on the AC power cord.

- A circuit overload can result in an electrical fire if the wires and/or fuse sizes are not correct. Use only the wire and fuse sizes written in the “Owner’s Manual and Installation Manual”

- To prevent child entrapment, make sure all shelf retainers are correctly fastened and remove the doors before disposing of the refrigerator.

**CAUTION:**

- The rear of the refrigerator has sharp edges and corners. To prevent cuts or abrasions when working on the refrigerator, be careful and wear cut resistant gloves.

- Make sure all fasteners and connections are tight.

Ventilation Requirements

**WARNING:** The completed installation must:

- Make sure there is sufficient intake of fresh air for combustion.

- Make sure the living space is completely isolated from the combustion system of the refrigerator.

- Make sure there is complete and unrestricted ventilation of the flue exhaust which, in gas mode, can produce carbon monoxide. The breathing of carbon monoxide fumes can cause dizziness, nausea, or in extreme cases, death.

Certified installation needs one lower intake vent and one upper exhaust vent. Install the vents through the side wall of the vehicle exactly as instructed in this manual. Any other installation method voids both the certification and the factory warranty of the refrigerator.

The bottom of the opening for the lower intake vent, which is also the service access door, must be even with or immediately below the floor level. This allows any leaking LP gas to escape to the outside and not to collect at floor level.

American Gas Association/Canadian Gas Association (AGA/CGA) certification allows the refrigerator to have zero (0) inch minimum clearance at the sides, rear, top, and bottom. While there are no maximum clearances specified for certification, the following maximum clearances are necessary for correct refrigeration:

<table>
<thead>
<tr>
<th>Bottom</th>
<th>0 inch min.</th>
<th>0 inch max.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Each Side</td>
<td>0 inch min.</td>
<td>1/2 inch max.</td>
</tr>
<tr>
<td>Top</td>
<td>0 inch min.</td>
<td>1/4 inch max.</td>
</tr>
<tr>
<td>Rear</td>
<td>0 inch min.</td>
<td>1 inch max.</td>
</tr>
</tbody>
</table>

These clearances plus the lower and upper vents cause the natural air draft that is necessary for good refrigeration. Cooler air goes in through the lower intake vent, goes around the refrigerator coils where it removes the excess heat from the refrigerator components, and goes out through the upper exhaust vent. If this air flow is blocked or decreased, the refrigerator may not cool correctly.

Each NORCOLD model is certified by AGA and CGA for correct ventilation.

| LP Gas Components |

This refrigerator operates on LP gas at a pressure of 10.5 inches Water Column min. to 11.5 inches Water Column max.

**WARNING:** Be very careful when working on or near the LP gas system.

- Do not smoke, or use an open flame near the LP gas system.

- Do not use an open flame to examine for leaks.

- Do not connect the refrigerator to the LP gas tank without a pressure regulator between them.

- To avoid possible LP gas leaks, always use two wrenches to tighten or loosen the LP gas supply line connections.

- Leaking LP gas can ignite or explode and result in dangerous personal injury or death.

**Examine the LP gas supply system for leaks:**

**WARNING:** Do not allow the leak detecting solution to touch the electrical components. Many liquids are electrically conductive and can cause a shock hazard, electrical shorts, and in some cases fire.

Using a solution of liquid detergent and water, make sure the LP gas supply line and all gas connections have no leaks. Do not use any liquid that contains ammonia.

If you use compressed air for the test:

- The pressure of the compressed air at the manual shutoff valve of the refrigerator must not be more than 1/2 psig (14 inches Water Column).

- If the pressure of the compressed air is more than 1/2 psig (14 inches Water Column), remove the gas supply line from the manual shutoff valve of the refrigerator before the test.

- If the pressure of the compressed air is equal to or less than 1/2 psig (14 inches Water Column), close the manual shutoff valve of the refrigerator before the test.
Electrical Components

This refrigerator operates on these electrical sources.

AC Operation 120 volts AC voltage
(132 volts max. - 108 volts min.)

DC Operation 12 volts DC control voltage
(15.4 volts max. - 10.5 volts min.)

Operation out of these limits may damage the refrigerator’s electrical circuit parts and will void the warranty.

Examine the 120 volts AC supply:

WARNING: Connect the AC power cord only to a grounded three-prong receptacle. Do not remove the round ground prong from the power cord. Do not use a two-prong adapter or an extension cord. Operation of the refrigerator without a correct ground could cause dangerous electrical shock or death if you are touching the metal parts of the refrigerator or the vehicle.

- Make sure the AC power cord is in a grounded three-prong receptacle.
- Make sure the receptacle is within easy reach of the lower intake vent.
- Make sure the power cord does not touch the burner cover, the flue pipe, or any hot component that could damage the insulation of the power cord.

Examine the 12 volt DC supply (3-way models):

The refrigerator gets power from the 12 volt system of the vehicle; either from the battery or from an auxiliary (house) battery. The battery system not only supplies DC power to the refrigerator, but also to other components of the vehicle.

The DC heating element, which supplies power for cooling during DC operation, has a high current draw and can cause rapid battery drain.

The minimum size of wiring to supply this current from the battery is 12 AWG.

- Make sure the DC negative wire from the battery is connected to the black DC wire on the terminal block of the refrigerator.
- Make sure the DC positive wire from the battery is connected to the red DC wire on the terminal block of the refrigerator.
- Make sure an in-line fuse is installed on the DC positive wire, as near the battery as possible, between the battery and the terminal block of the refrigerator.

NOTE: This in-line fuse is necessary for added safety, even though the refrigerator has a DC fuse in the control assembly.

Controls

The thermostat [1] changes the amount of LP gas that goes to the burner (See Art01029). This acts as the temperature control of the refrigerator. Number 5 is the coldest temperature setting.

NOTE: This is not an automatic gas control. It does not change the flame from high fire to low fire as do other RV refrigerators. If the cooling load changes, you must manually change the gas control to maintain the same temperature inside the refrigerator.

When the outside air temperature is less than 50° F, the refrigerator may have a tendency to freeze food at the colder temperature settings. To reduce the tendency to freeze food:

- Turn the thermostat to a warmer temperature setting.
- Keep the refrigerator full.
- Put foods that are more likely to freeze on the upper shelf.

The selector switch [2] changes the energy source of the refrigerator between LP gas ( ), AC electric ( ), and DC electric ( ) and shuts down the refrigerator at the OFF ( ) position.

The gas safety valve [3] is built into the control panel. As long as a flame is present, the valve is open and allows LP gas to flow into the burner. Any loss of flame (empty LP gas tank, blow out, etc.) causes valve to close and stops flow of LP gas.

The igniter [4] makes a spark which ignites the flame in the burner.
Before ignition or startup of the refrigerator:
- Make sure the air flow in the lower intake vent, through the refrigerator coils and condenser, and out the upper exhaust vent is not blocked or decreased.
- Make sure there are no combustible materials in or around the refrigerator.

Ignition - LP gas operation:
1. Open the valve at the LP gas storage tank.
2. Turn the thermostat to the coldest temperature setting.
3. Turn the selector switch to the LP gas position (△).
4. Push and hold in the safety valve and in rapid succession, push in the igniter several times for about five seconds:

**WARNING:** Do not hold the safety valve in more than 30 seconds. If there is no flame in this time, wait at least five minutes before you try ignition again. If you continue to hold in the safety valve, gas will collect in the burner area. This could cause a fire or explosion and result in dangerous personal injury or death.
- Open the burner box door [3] and look at the flame (See Art01035).
- When the flame ignites (~15 sec.), release the safety valve.
- If the flame does not ignite, wait about five minutes and do this step again.
5. Turn the thermostat to the temperature setting that you wish.

Start up - AC electric operation:
- Make sure that 120 volts AC is available.
- Turn the selector switch to the AC position (← ).
- Turn the thermostat to the temperature setting that you wish.

Start up - DC electric operation (3-way models):
- Make sure that 12 volts DC is available.
- Turn the selector switch to the DC position (→).
- Turn the thermostat to the temperature setting that you wish.

Shut down:
- Turn the selector switch to the OFF position (○).
- Turn the thermostat to the 1 position.

Battery drain:
- In AC operation, there is no battery drain.
- In DC operation, the refrigerator draws 10-12 amps at 12 - 14 volts.
- If the battery charging stops during DC operation, change the refrigerator to LP gas or AC until the battery charging starts again.
- Check the voltage when in DC operation. The voltage should never drop below 10.5 volts.

Gas flame appearance:
While in LP gas operation, examine the gas flame:
- Open the lower intake vent.
- Turn the thermostat to the 5 position.

**CAUTION:** The burner box cover can be hot. Wear gloves to avoid burns.
- Open the burner box door [3] and look at the gas flame [1] (See Art01035 and Art00955).
  - The flame should be a darker blue inside and a lighter blue outside and should be a constant and steady shape.
  - The flame should not be yellow and should not have an erratic and unstable shape.
  - Make sure the flame does not touch the inside of the flue tube [2].
- Close the burner box door.

Remove and clean the burner orifice:
NOTE: A dealer or a Norcold authorized Service Center must do this procedure.

To remove and clean the burner orifice:
- Close the valve at the LP gas tank(s).
- Close the manual shut of valve of the refrigerator.
- Turn the gas control to the OFF positon (○).

**CAUTION:** The burner box cover can be hot. Wear gloves to avoid burns.
- Open the lower intake vent.
- Remove the flare nut from the orifice assembly [1] (See Art00956).
- Remove the orifice assembly from the burner [2].
**WARNING:** When cleaning, do not try to remove the orifice [3] from the orifice adapter [4]. Removal will damage the orifice and seal of the orifice and can cause a LP gas leak. Leaking LP gas can ignite or explode and result in dangerous personal injury or death. Do not clean the orifice with a pin or other objects.

- Clean the orifice assembly with air pressure and alcohol only.
- Using a wrench, assemble the orifice assembly to the burner.
- Assemble the flare nut to the orifice assembly.
- Examine all of the LP gas connections for leaks.

**Diagnosing Cooling Problems**

**WARNING:** The refrigerator cooling system is under pressure. Do not try to repair or to recharge a defective cooling system. The cooling system contains sodium chromate. The breathing of certain chromium compounds can cause cancer. The cooling system contents can cause severe skin and eye burns, and can ignite and burn with an intense flame. Do not bend, drop, weld, move, drill, puncture, or hit the cooling system.

Make sure the cooling unit has the correct ventilation:

- Make sure that the intake and exhaust vents are not blocked.
- Make sure that the air flow through the back of the refrigerator is not decreased or blocked.
- Make sure the ventilation baffle is correctly installed.

Examine the cooling unit for leaks:

- If you smell ammonia, the cooling unit has a leak and must be replaced.
- If you see a yellow powder or residue anywhere at the rear of the refrigerator or in the enclosure, the cooling unit has a leak and must be replaced.

Determine if the cooling problem occurs while operating the refrigerator on LP gas, AC electric, and DC electric:

- Determine if the selected energy source is operating and heating correctly:

  **CAUTION:** Touch only the outside of the insulation sleeve. During normal operation, some tubes of the cooling unit are hot. Do not touch any tubes of the cooling unit.

  - Within 20 minutes of starting the refrigerator, touch the outside of the insulation sleeve.
  - The outside of the insulation sleeve should be warm to the touch.

- If the outside of the insulation sleeve is not warm, the selected energy source may not be operating correctly.
- Start up the refrigerator on a different energy source and repeat the procedure for all energy sources.
- If the outside of the insulation sleeve is warm to the touch, make sure the unit is cooling correctly.
- Within one hour after starting up the refrigerator, touch the fins on the inside of the fresh food compartment.
- The fins should feel cold to the touch.
- If the fins do not feel cold to the touch after two hours, the cooling unit is not operating correctly.
- If the cooling problem does not occur when operating on all energy sources, the problem is not the cooling unit.
- Use the “Troubleshooting Charts” to determine the cause of the problem.

**Wiring Pictorial**

The parts or the wiring pictorial are (See Art01022):

1. 120 VAC Power cord
2. Chassis ground
3. Interrupter
4. 3 Amp fuse
5. AC heater
6. Jumper
7. Terminal block
8. Jumper / gas safety valve
9. Selector switch
10. 20 Amp fuse (3-way models)
11. 12 VDC Power supply (3-way models)
12. DC heater (3-way models)

**Wiring Diagram**

The parts of the wiring diagram are (See Art01023):

1. 120 VAC
2. 3 Amp fuse
3. Thermostat
4. AC heater
5. 120 VAC
6. AC ground
7. Spark gap
8. Piezo lighter
9. Gas safety valve
10. Thermocouple interrupter
11. Thermocouple
12. +12 VDC (3-way models)
13. 20 Amp fuse (3-way models)
14. DC heater (3-way models)
Refrigerator will not operate on AC.

- Is selector switch in the AC position?
  - NO: Turn selector switch to AC and start up.
  - YES: Is thermostat at mid-range or higher?
    - NO: Put thermostat at mid-range or higher & start up.
    - YES: Is circuit breaker or fuse blown? (AC source)
      - NO: Reset breaker or replace fuse and start up.
      - YES: Are any wire connections loose?
        - NO: Put the cord in the receptacle and start up.
        - YES: Repair connections and start up.

- Is AC voltage at output of selector switch?
  - NO: Replace selector switch and start up.
  - YES: Is AC voltage at input of selector switch?
    - NO: Correct power source to selector switch.
    - YES: Is AC voltage at output of 3 Amp fuse?
      - NO: Replace 3 Amp fuse and start up.
      - YES: Is AC voltage at input of 3 Amp fuse?
        - NO: Correct power source to 3 Amp fuse.
        - YES: Is AC voltage at terminal block?
          - NO: Correct power source to terminal block.
          - YES: Replace AC heater.

- Is AC voltage at input of thermostat?
  - NO: Correct power source to thermostat.
  - YES: Is AC voltage at output of thermostat? (black wire)
    - NO: Replace thermostat and start up.
    - YES: Replace AC heater.
Refrigerator will not operate on DC.

Is selector switch in the DC position?

- YES: Turn selector switch to DC and start up.
- NO: Is circuit breaker or fuse blown? (DC source)
  - YES: Replace DC heater.
  - NO: Are any wire connections loose?
    - YES: Repair connections and start up.
    - NO: Is DC voltage at terminal block?
      - YES: Correct power source to terminal block.
      - NO: Is DC voltage at input of 20 Amp fuse?
        - YES: Correct power source to 20 Amp fuse.
        - NO: NO
Part Replacement

If the "Troubleshooting Charts" tell you to replace a part, use the following instructions.

Selector switch
1. Close the valve of the LP gas tank(s).
2. Remove the control panel from the back of the refrigerator.
3. Remove the burner tube from the burner assembly.
4. Pull the knob off the selector switch.
5. Remove the two screws that attach the selector switch.
6. Gently pull the selector switch away from the back of the control panel.
7. Remove each wire, one at a time, from the selector switch and install in exactly the same location on the replacement selector switch. (See Art01022 and Art01023)
8. To install the replacement selector switch, do steps 1-7 in reverse.

Thermostat
1. Close the valve of the LP gas tank(s).
2. Remove the control panel from the back of the refrigerator.
3. Pull the knob off the thermostat.
4. Remove the gas supply line from the inlet flare fitting of the thermostat.
5. Remove the burner tube from the burner assembly.
6. Remove thermocouple then safety valve from thermostat.
7. Remove the two screws that attach the thermostat to the bracket.
8. Remove the two red wires from the thermostat.
9. Remove the clips that attach the capillary tube tube to the cooling fin inside the refrigerator.
NOTE: The capillary tube is located on the fifth cooling fin from the right.
10. Gently pull the capillary tube through the back of the refrigerator cabinet.
11. To install the replacement thermostat, do steps 1-10 in reverse.
12. Examine all the LP gas connections for leaks.

AC heater
1. Remove the AC power cord from the receptacle.
2. Remove the two black wires that connect the AC heater to the terminal block.
3. Using a utility knife, vertically cut through the insulation that surrounds the flue tube.
4. Remove the insulation.
5. Pull the AC heater up and out of the heater well.
6. Push the replacement AC heater down into the heater well.
   - Make sure the bead of weld on the AC heater touches the top of the heater well.
7. Put the insulation around the flue tube.
   - Make sure the insulation is completely around the flue tube.
8. Tape the insulation closed.
9. Attach the two black wires of the AC heater to the terminal block.
10. Put the AC power cord in the receptacle.

DC heater (3-way models)
1. Remove the DC input leads from the refrigerator.
   - Put tape on the positive lead to prevent an accidental electrical short and a blown fuse.
2. To make sure the other energy sources do not activate, turn the selector switch to DC.
3. Remove the two yellow wires that connect the DC heater to the terminal block.
4. Using a utility knife, vertically cut through the insulation that surrounds the flue tube.
5. Remove the insulation.
6. Pull the DC heater up and out of the heater well.
7. Push the replacement DC heater down into the heater well.
   - Make sure the bead of weld on the DC heater touches the top of the heater well.
8. Put the insulation around the flue tube.
   - Make sure the insulation is completely around the flue tube.
9. Tape the insulation closed.
10. Attach the two yellow wires of the DC heater to the terminal block.
11. Make sure that a 20 Amp fuse is in the fuse holder.
12. Attach the DC input leads from the refrigerator.
**Thermocouple**

1. Close the valve at the main LP gas tank(s).

2. Remove the thermocouple from the thermocouple interrupter.

3. Remove the burner box cover.

4. Remove the two screws that attach the thermocouple bracket to the burner box.

5. Remove the thermocouple from the thermocouple bracket.

6. Remove the control panel from the back of the refrigerator.

7. To install the replacement thermocouple, do steps 1-6 in reverse.

8. Examine all the LP gas connections for leaks.

**Thermocouple interrupter**

1. Close the valve at the main LP gas tank(s).

2. Remove the control panel from the back of the refrigerator.

3. Remove the thermocouple from the thermocouple interrupter.

4. Remove the wires from the thermocouple interrupter.

5. Remove the thermocouple interrupter from the safety valve.

6. To install the replacement thermocouple interrupter, do steps 1-5 in reverse.

7. Examine all the LP gas connections for leaks.

**Safety valve**

1. Close the valve at the main LP gas tank(s).

2. Remove the control panel from the back of the refrigerator.

3. Remove the thermocouple from the thermocouple interrupter.

4. Remove the wires from the thermocouple interrupter.

5. Remove the thermocouple interrupter from the safety valve.

6. Remove the LP gas outlet fitting from the safety valve.

7. Remove the safety valve from the thermostat.

8. To install the replacement safety valve, do steps 1-7 in reverse.

9. Examine all the LP gas connections for leaks.

**Refrigerator**

1. Close the valve at the main LP gas tank(s).

2. Remove the LP gas supply line from the bulkhead fitting of the refrigerator.

3. Remove the AC power cord from the receptacle.

4. Remove the DC input leads from the refrigerator.

   - Put tape on the positive lead to prevent an accidental electrical short and a blown fuse.

5. Remove the screws that attach the refrigerator to the floor.

6. Remove the screws that attach the refrigerator to the wall.

7. Remove the refrigerator from the opening.

8. To install the refrigerator, do steps 1-7 in reverse.

9. Examine all the LP gas connections for leaks.
All manuals are believed to be released for distribution, and/or in the public domain.

Service manuals provided with the understanding that persons using them are well versed in proper safety practices, and are familiar with basic safety procedures, including, but not limited to safety procedures dealing with 120 volt electricity, high amperage 12 volt circuits an LPG (propane) systems.

If in doubt, consult a professional (better safe than sorry).
